

Multifactor Authentication

Multifactor authentication refers to a device that can be enabled for use with your LastPass account and requires a second step before you can gain access to your account. You can set up [Policies](#) to require multifactor authentication for your Enterprise users. Multifactor authentication devices help protect your account from keyloggers and other threats – even if your Master Password were captured, someone would be unable to gain access to your account without this second form of authentication. LastPass offers several multifactor options for your Enterprise account, including:

```
[wc_row][wc_column size="one-half" position="first"]
```
